Proposal: Mount a Small Wireless Internet Antenna on the Roof of 4799 Shattuck

In order to expand the wireless Internet connection throughout the building, we would like to mount one small antenna on the roof using easily removable brackets. The antenna is a 12-inch diameter dish.

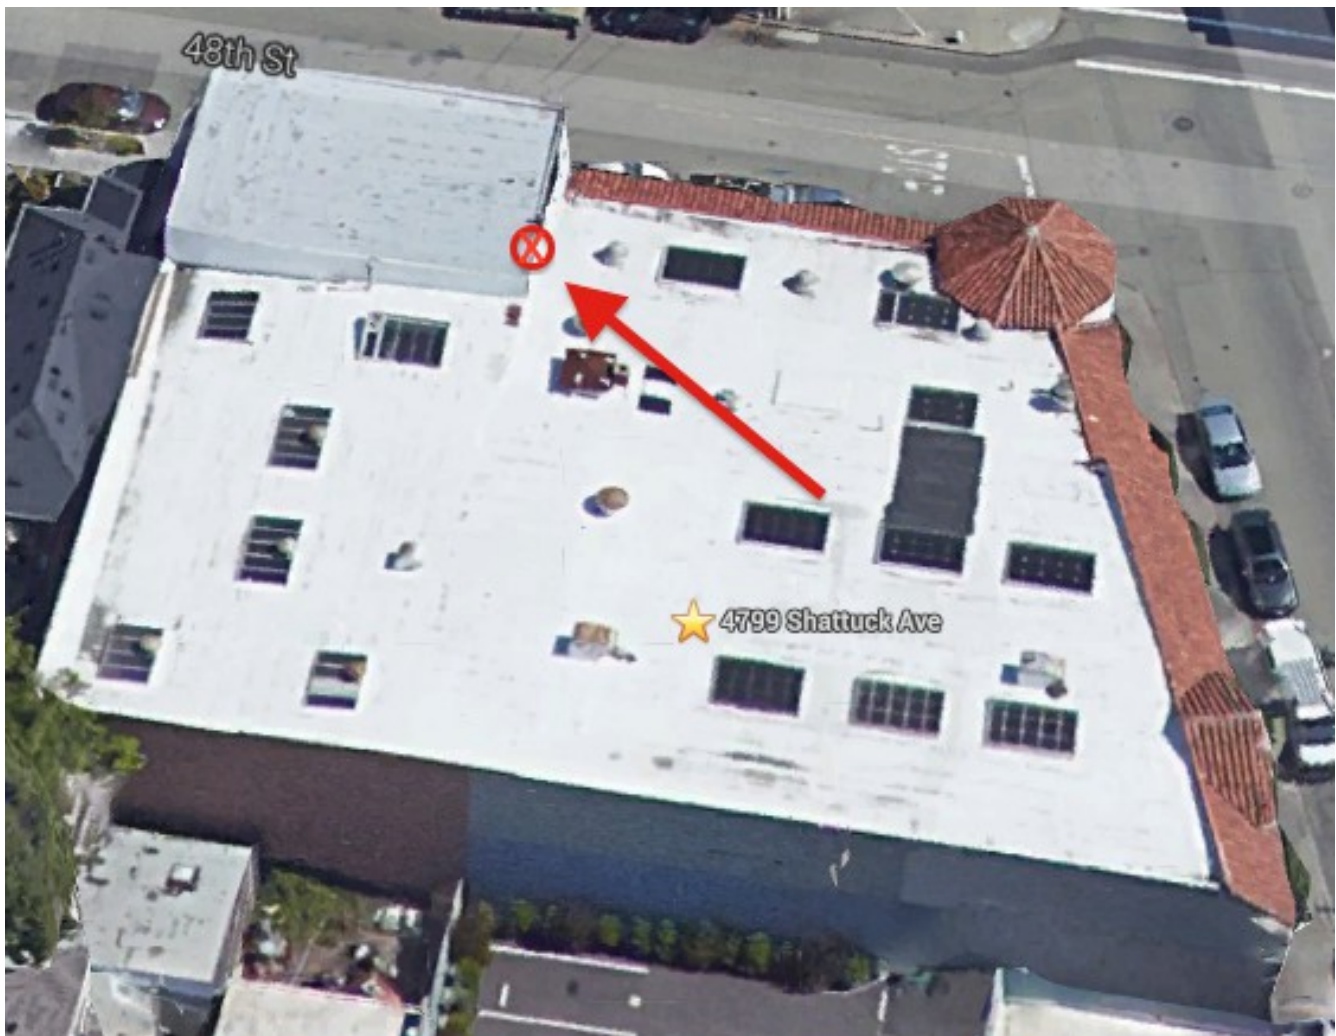

Where: The antenna will be installed above the disco room, on the southeast corner of the roof extension. The mounting pole will extend roughly one foot above the height of the roof, where the dish will be attached.

Impact on the building: Very minimal and impermanent. The antenna is smaller than most domestic satellite television dishes. We will secure a one-meter long pole to the wall of the roof extension using a few brackets and screws that can easily be removed.

We agree to remove the antenna if necessary and to patch the screw holes on the wall of the roof after removing the mount.

Technical specifics of the antenna: One dish antenna of the Ubiquiti Nanobridge M5 NBM5-25 model
