

# MESH NETWORK IN YOUR HOME

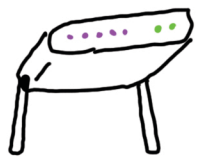

The HOME ACCESS POINT provides two types of internet.

A Private Network connects your personal devices to the mesh.

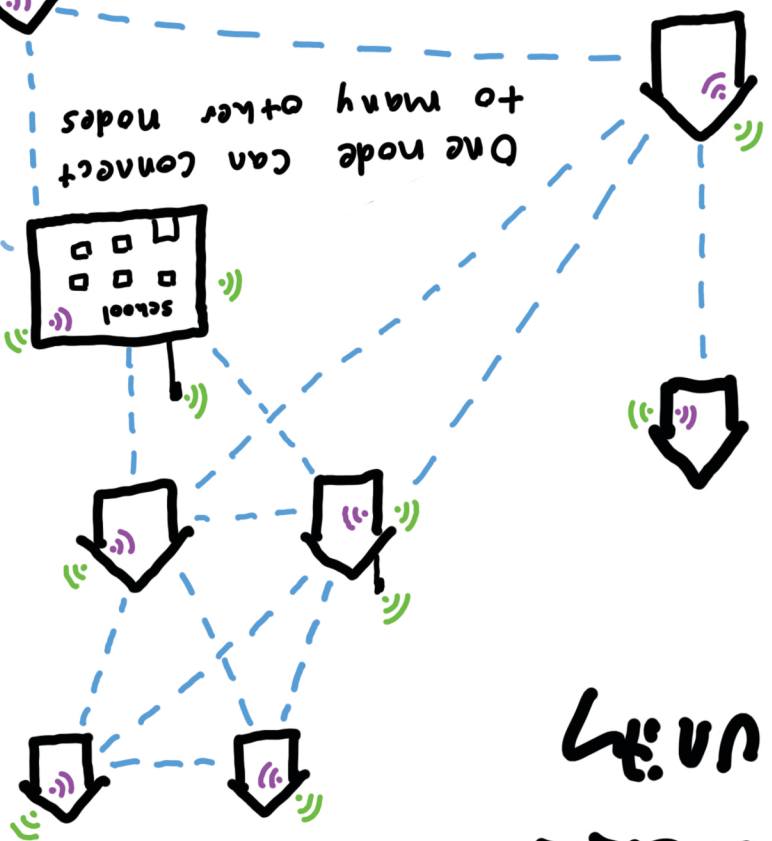

A Public Network lets you share the mesh with neighbors. This network access can be capped to ensure that your private network is fast.

## HOME NODE

Your home node is just like a regular wireless router, but it is loaded with Open Source software that lets you connect and share internet more freely.

# MESH NETWORK IN THE COMMUNITY

Your home is one node among many.

Nodes connect to each other and share bandwidth through wifi.

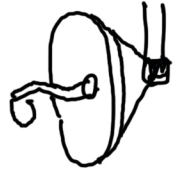

Each additional node adds to the speed and resiliency of the entire network

When some nodes choose to share access to the internet, it provides internet access for all of the nodes

This connection to the larger internet happens through a Virtual Public Network (VPN) for the safety of everyone.

## EXTENDER NODE

A Rooftop extender node can be added to make long range connections, or it can be used to create high powered Public Networks in your community.

## MESH THE PLANET!
